             double-stranded CDNA was size selected, ligated to Eco R adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatima Bonaldo."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         went through one round of normalization, and was constructed by Bento Soares and M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note-*Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. " a 28 c 23 g 27 t 2 cthers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PS Claim 6; Column 179-180; 264pp; English.

CC The sequences given in T63713-4312 represent duplex DNA's which act CC as target regions in the method of the invention. The method for a starget regions in the method of the invention. The method for CC altering the binding characteristics of a DNA-binding protein to duplex DNA with a small molecule which the sequence-specifically to a target region, where, when the small CC binds sequence-specifically to a target region, where, when the small CC molecule is bound to the target region, it is adjacent to, but not concerning by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the concerning by more than 4 bp, a binding site for a DNA-binding site on the duplex DNA. The binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding protein to its binding site. The CC compounds isolated using this method are potentially useful as therapeutic agents for treatment of any disease which involves a generation of sequence, e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical CC The method is suitable for screening large biological or chemical CC affinities of known DNA-binding agents for different DNA sequences. CC The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding DNA control of the control of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

PT Claim 6; Column 185-186; 264pp; English.

CC The sequences given in T63713-4312 represent duplex DNA's which act CC asterget regions in the method of the invention. The method for CC altering the binding characteristics of a DNA-binding protein to duplex CC DNA comprises contacting the duplex DNA with a small molecule which CC DNA comprises contacting the duplex DNA with a small molecule which CC binds sequence-specifically to a target region, where, when the small cc molecule is bound to the target region, it is adjacent to, but not converlapping by more than 4 bp, a binding site for a DNA-binding protein. CC The small molecule is added at a concentration effective to alter the contact converlapping of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding of the small molecule may inhibit or enhance compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as specific DNA sequence, e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical contact the second of these duplex DNA's allows a single DNA:protein DNA binding sequences. The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding the contact of the design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding the contact of the sequence almost any possible sequence (see also T49539-

CC Sequences X17001 to X17600 represent specifically claimed target test columns sequence of a DNA-binding molecule. The method comprises:

CC DNA sequence preference of a DNA-binding protein to a mixture of couls and a DNA-binding protein to a mixture of couls and a DNA-binding protein to a mixture of couls and a DNA-binding protein with a binding screening sequence adjacent to a screening sequence, where the construction of the DNA-binding protein with a binding can affinity that is independent of the DNA-binding protein with a binding considered that the mixture of duplex DNA sequence of the test sequence, cand where the mixture of duplex DNA test oligonucleotides includes several test sequences; (ii) incubating the test molecule, the mixture of duplex DNA test oligonucleotides includes several test sequences; (ii) incubating the test molecule, the mixture of coligonucleotides and the DNA-binding protein for a time coligonucleotides bound to binding protein; (iv) amplifying the unbound test oligonucleotides from test coligonucleotides; (v) repeating steps (ii) to test sequences in the amplified test oligonucleotides; and (vi) sequencing the isolated test oligonucleotides. Test sequences and test sequences X17482-X17599 correspond to promoter targets for viral genes.

The sequences given in T63713-4312 represent duplex DNA's which act as target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA comprises contacting the duplex DNA with a small molecule which binds sequence-specifically to a target region, where, when the small molecule is bound to the target region, it is adjacent to, but not overlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding of the small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site. The compounds isolated using this method are potentially useful as therapeutic agents for treatment of any disease which involves a specific DNA sequence, e.g. cancer, or inherited genetic disorders etc.
                                                                                                                                                                                                                                                                                                                                                                          26-NOV-1991; 723618.

PT Determination of DNA sequence preference of a DNA-binding molecule - PT based on inhibition of binding of protein to oligonucleotide PT sequence attached to test sequence PT sequence attached to test sequence PT sequences X17001 to X17600 represent specifically claimed target test CC sequences X17001 to X17600 represent specifically claimed target test CC sequences X17001 to X17600 represent specifically claimed target test CC sequences that are used in the method of the invention of determining the CC INA sequence preference of a DNA-binding molecule. The method comprises: CC (1) adding a test endecule and a DNA-binding protein to a mixture of duplex DNA test oligonucleotides, each of the test oligonucleotides CC affinity that is independent of the DNA sequence of the test sequence, where the mixture of duplex DNA test oligonucleotides includes and where the mixture of duplex DNA test oligonucleotides includes and where the mixture of duplex DNA; (iii) separating who test molecule to test sequences in CC sufficient to permit binding of the test molecule, the mixture of oligonucleotides bound test oligonucleotides from test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the suplified test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the abolated test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the solated test oligonucleotides; (v) rest sequences X17001-X17481 and X17600 correspond to promoter targets for viral genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The method is suitable for screening large biological or chemical libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences. The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also T49539-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             06-MAY-1999 (first entry)
Test sequence from human histone H2a gene.

CC A DNA protein-binding assay is provided, useful for screening

CC libraries of synthetic or biological cpds. for their ability

CC to bind DNA test sequences. The assay is versatile in that any

CC number of test sequences can be tested by placing the test sequence

CC adjacent to a defined protein-binding screening sequence. Binding

CC of mols. to these test sequences changes the binding characteristics

CC of the protein mol. to its cognate binding sequence. When such a mol.

CC of the protein mol. to its cognate binding sequence. When such a mol.

CC of the protein mol. to its cognate binding sequence. When such a mol.

CC is disturbed, generating changes in the concentration of free DNA probe.

CC is disturbed, generating changes in the concentration of free DNA probe.

CC one application of this method is to eucaryotic general transcription

CC factors (e.g. TFIID), where the target region is typically selected

CC transcription factor. Numerous exemplary test sequences are given:

CC the sequences adjacent to the binding site for the eucaryotic

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor of the binding site for the eucaryotic

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences are given:

CC transcription factor. Numerous exemplary test sequences in the sequences in the sequences of the sequences in the sequences of the sequences in the sequences.

CC of the protein mol. to the protein transcription and UD (see 059851-52, 069855 and 069891
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in T63713-4312 represent duplex DNA's which act CC as target regions in the method of the invention. The method for CC altering the binding characteristics of a DNA-binding protein to duplex CNA comprises contacting the duplex DNA with a small molecule which CC DNA comprises contacting the duplex DNA with a small molecule which CC binds sequence-specifically to a target region, where, when the small CC molecule is bound to the target region, it is adjacent to, but not CC overlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the Dinding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding protein to its binding site. The CC binding of the DNA-binding protein to its binding site. The CC compounds isolated using this method are potentially useful as CC therapeutic agents for treatment of any disease which involves a CC therapeutic agents for treatment of any disease which involves a CC therapeutic agents for screening large biological or chemical CC libraries and allows determination of sequence-specific and relative CC affinities of known DNA-binding agents for different DNA sequences. CC The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding the protein that recoming sequence-specific protein interaction of sequence and allows determined and protein states and protein states and protein sequence and protein interaction contacts and protein sequence and protein sequence and protein interaction to be used for screening sequence-specific, or preferential, DNA binding the protein sequence and protein interaction interaction in the protein sequence and protein sequence and protein sequence and protein interaction interact
Determination of DNA sequence preference of a DNA-binding molecule -
property based on inhibition of binding of protein to oligonucleotide
process of inhibition of binding of protein to oligonucleotide
process of the sequence
process of the sequence of a DNA-binding molecule. The method comprises:
Claim 3; Columns 185-186; 270pp; English.
Sequences X17001 to X17600 represent specifically claimed target test
sequences x17001 to X17600 represent specifically claimed target test
Claim 3; Columns 185-186; 270pp; English
Sequences X17001 to X17600 represent specifically claimed target test
claim 3; Columns 185-186; 270pp; English
Sequences x17001 to X17600 represent specifically claimed target test
Claim 3; Columns 185-186; 270pp; English

Test sequences x17001-x17481 and x17600 correspond to promoter targets for human genes and test sequences x17482-x17599 correspond to promoter targets for rural genes.

                                                                                                                                                                                                                                                               Detecting proliferating cells in tissue or cell samples - by probes specific for histone manh for radioactively labelled oligonuclectide probes specific for histone manh for the sequences given in 062216-18 are probes which are specific for histone H3 mRNA. These probes may be used in the method of the invention for detecting the presence of proliferating cells in a converted for the succession of the method comprises preparing the tissue/cell cample. The method comprises preparing the tissue/cell cample, hybridising these non-radioactively labelled probes, and detecting the presence of histone-probe hybrids. The method can be used to identify cells undergoing proliferation in normal and diseased tissue. It can be used in the diagnosis of cancers and in assessing the carainogenic properties of a chemical.
